# **Overview of phenotypic values – BeefxDairy evaluation**

Tables 1 and 2 contain current phenotypic averages and values per one breeding value unit (+1 EBV-unit) for carcass and calving traits included in NAV's beefxdairy evaluation

A bull's effect on the offspring for a single trait can be calculated as: Bull EBV deviation from mean \* value for 1 EBV unit

A bull's average performance in the offspring for a single trait can be calculated as: Bull EBV deviation from mean \* value for 1 EBV unit + average (within country and gender)

### **Carcass traits**

In Denmark, a short rearing period (<550 days at slaughter) is generally applied and values for long period is therefore not available. In Sweden and Finland, a long rearing period (>550 days at slaughter) is generally applied, but values for both short and long rearing period is available.

Table 1. Value of 1 index unit and average for carcass traits depending on country, gender, and rearing period.

| Carcass traits |         |                     |          |                     |          |                    |          |                   |          |
|----------------|---------|---------------------|----------|---------------------|----------|--------------------|----------|-------------------|----------|
|                |         | Carcass daily gain, |          | Carcass daily gain, |          | Carcass            |          | Carcass fat score |          |
|                |         | short (kg/day)      |          | long (kg/day)       |          | conformation score |          | (1 – 5)           |          |
|                |         |                     |          |                     |          | (1 – 15)           |          |                   |          |
| Gender         | Country | Average             | Value/+1 | Average             | Value/+1 | Average            | Value/+1 | Average           | Value/+1 |
|                |         |                     | EBV unit |                     | EBV unit |                    | EBV unit |                   | EBV unit |
| Female         | Sweden  | 0.474               | 0.0017   | 0.407               | 0.0010   | 6.4                | 0.029    | 3.0               | 0.010    |
| Female         | Denmark | 0.569               | 0.0015   |                     |          | 6.9                | 0.031    | 2.9               | 0.009    |
| Female         | Finland | 0.486               | 0.0014   | 0.443               | 0.0013   | 6.4                | 0.031    | 2.8               | 0.015    |
| Male           | Sweden  | 0.645               | 0.0014   | 0.587               | 0.0014   | 6.7                | 0.030    | 2.5               | 0.010    |
| Male           | Denmark | 0.677               | 0.0014   |                     |          | 7.5                | 0.039    | 2.4               | 0.010    |
| Male           | Finland | 0.656               | 0.0015   | 0.633               | 0.0013   | 7.9                | 0.040    | 2.4               | 0.013    |

#### Example for daily gain - effect in Danish female raised in short rearing period:

Bull with EBV for carcass daily gain of 110: (110 - 100) \* 0.0015 = 0.015 kg/day = 15 g/day. That is, female crossbred offspring is expected to grow 15 g/day faster than female crossbred offspring from a bull with 100 in EBV.

For the above bull, the expected performance is 0.569 kg/day + 0.015 kg/day = 0.584 kg/ day = 584 g/day

# **Calving traits**

Calving ease is registered on a scale from 1-5 and it is therefore difficult to express average and effect of 1 index unit in an understandable way. Hence a bull with 110 in calving ease will give less difficult calving's with/without help and more calving's without help. To make interpretation easier it is expressed as increase in share of easy calving's without help in table 3.

Table 2. Value of 1 index unit and average for calving traits depending on country and lactation of dam. **Calving traits** 

|         | Calf survival              |          | Calf surviva             | •        | Calving ease,             | Calving ease,    |  |
|---------|----------------------------|----------|--------------------------|----------|---------------------------|------------------|--|
|         | $1^{st}$ lactation (0 – 1) |          | later lactations (0 – 1) |          | 1 <sup>st</sup> lactation | later lactations |  |
|         |                            |          |                          |          | (point)                   | (point)          |  |
| Country | Average                    | Value/+1 | Average                  | Value/+1 | Value/+1 EBV              | Value/+1 EBV     |  |
|         |                            | EBV unit |                          | EBV unit | unit                      | unit             |  |
| Denmark | 0.913                      | 0.00297  | 0.963                    | 0.0010   | 0.0107                    | 0.0052           |  |
| Finland | 0.924                      | 0.00295  | 0.956                    | 0.0012   | 0.0104                    | 0.0058           |  |
| Sweden  | 0.953                      | 0.00236  | 0.969                    | 0.0010   | 0.0082                    | 0.0045           |  |

## Example for calf survival – effect in Finland for calf's born by cows in 2<sup>nd</sup> and later lactations:

Bull with EBV for calf survival of 110: (110 - 100) \* 0.0012 = 0,012 liveborn calves = 1.2% more liveborn calves, compared to bull with EBV of 100.

For the above bull, the expected total performance is 95,6% liveborn calves + 1.2% liveborn calves = 96.8% liveborn calves

Table 3. Expected percentage of easy calving without help in later lactations when a bull with EBV 90, 100 or 110 is used

|         | Bull EBV = 90 | Bull EBV = 100 | Bull EBV = 110 |
|---------|---------------|----------------|----------------|
| Denmark | 81.8          | 85.5           | 89.3           |
| Finland | 77.7          | 81.8           | 86.1           |
| Sweden  | 88.2          | 91.2           | 94.4           |
